

Beyond Prompts: Codifying Agent Expertise

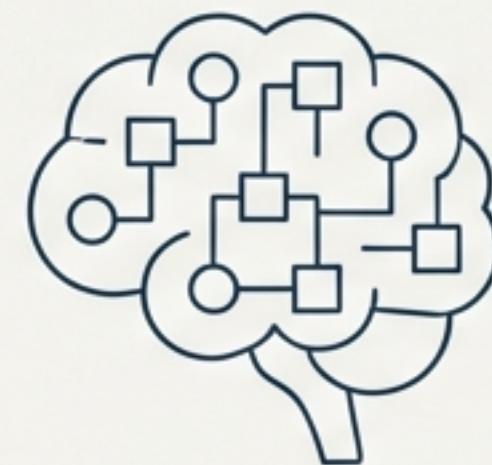

Introducing Agent Skills, an open standard for reliable AI.

AI agents are capable, but they lack critical context.

Agents are increasingly powerful, but often don't have the context they need to do real work reliably.

This gap leads to inconsistencies and failures in complex, multi-step tasks that require deep procedural knowledge.

Agent Brain

Procedural
Knowledge
& Context

Real-World
Task

The Context Gap

Skills solve this by giving agents access to procedural knowledge and company-, team-, and user-specific context they can load on demand.

Witness an agent perform a complex database task, flawlessly.

User Request: Generate a complete Knowledge Graph from my Northwind SQL tables.

Clarify & Confirm

1

Agent: 'First, which Virtuoso instance? Demo or URIBurner?'

User: 'Demo.'

Agent: 'I've discovered these tables in the 'northwind' schema: 'Customers', 'Orders'. Do you approve?'

[Calls: Demo:execute_sql_query with table discovery query]

2

Generate & Propose

Agent: 'I have generated a 142-line SQL script to create the RDF Views and metadata. Should I execute this script?'

[Calls: Demo:RDFVIEW_FROM_TABLES with tables: [...Customers", "...Orders"]]

3

Execute & Audit

Agent: "✓ Script executed successfully (2.3 seconds). Running post-audit..."

[Calls: Demo:EXECUTE_SQL_SCRIPT] and [Calls: Demo:RDF_AUDIT_METADATA with audit_level: 2]

4

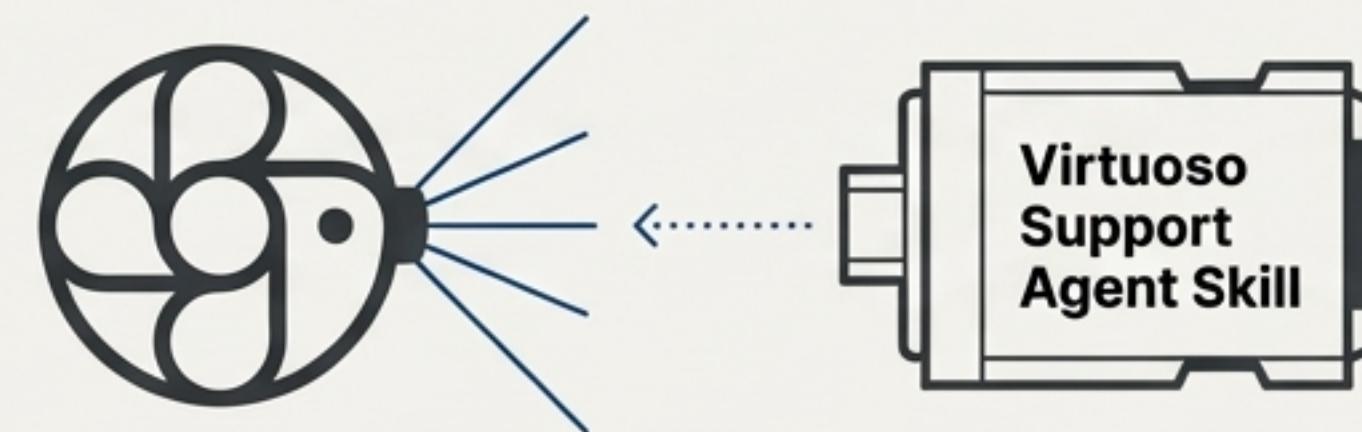

Verify & Deliver

Agent: "✓ Success! RDF Views created and verified. Your data is now accessible via Linked Data URIs like 'http://demo.example.com/northwind/Customers/ALFKI' and a SPARQL endpoint."

[Calls: Demo:sparqlQuery with verification query]

How is this possible?

This wasn't a custom-built agent.
It's a standard agent using a
portable **Agent Skill**.

What is an Agent Skill?

A simple, open format for giving agents new capabilities and expertise. Agent Skills are folders of instructions, scripts, and resources that agents can discover and use to do things more accurately and efficiently.

The anatomy of a skill starts with `SKILL.md`.

```
virtuoso-support-agent/  
  └─ SKILL.md  
  └─ references/  
  └─ ...
```

The Handshake (YAML Frontmatter)

The agent's first glance. Lightweight metadata used for discovery and activation.

~100 tokens

```
---  
name: virtuoso-support-agent  
description: Technical support and database  
management for OpenLink Virtuoso Server with  
RDF Views generation, SPARQL queries...  
---
```

The Playbook (Markdown Body)

The full set of instructions, workflows, and rules loaded **after** the skill is activated.

Recommended < 5000 tokens

```
### Virtuoso Support Agent Skill  
#### When to Use This Skill...
```

Inside the playbook: Structuring procedural knowledge.

Activation Triggers

Defines its precise domain of expertise.

When to Use This Skill

Use when users need:

- * Technical support for Virtuoso Server
- * RDF Views generation from RDBMS tables...

SKILL.md

Codified Workflows

Step-by-step, auditable processes for complex tasks.

RDF Views Generation Workflow

Core 9-step process...

1. Confirm instance
2. Discover tables
3. Get approval...

The Toolkit

The complete list of actions the agent can perform.

Available MCP Tools (23 Total)

- Entity Discovery (4 tools)
- Database Scripts (1 tool)
- RDF Views Generation (7 tools)...

Guardrails & Rules

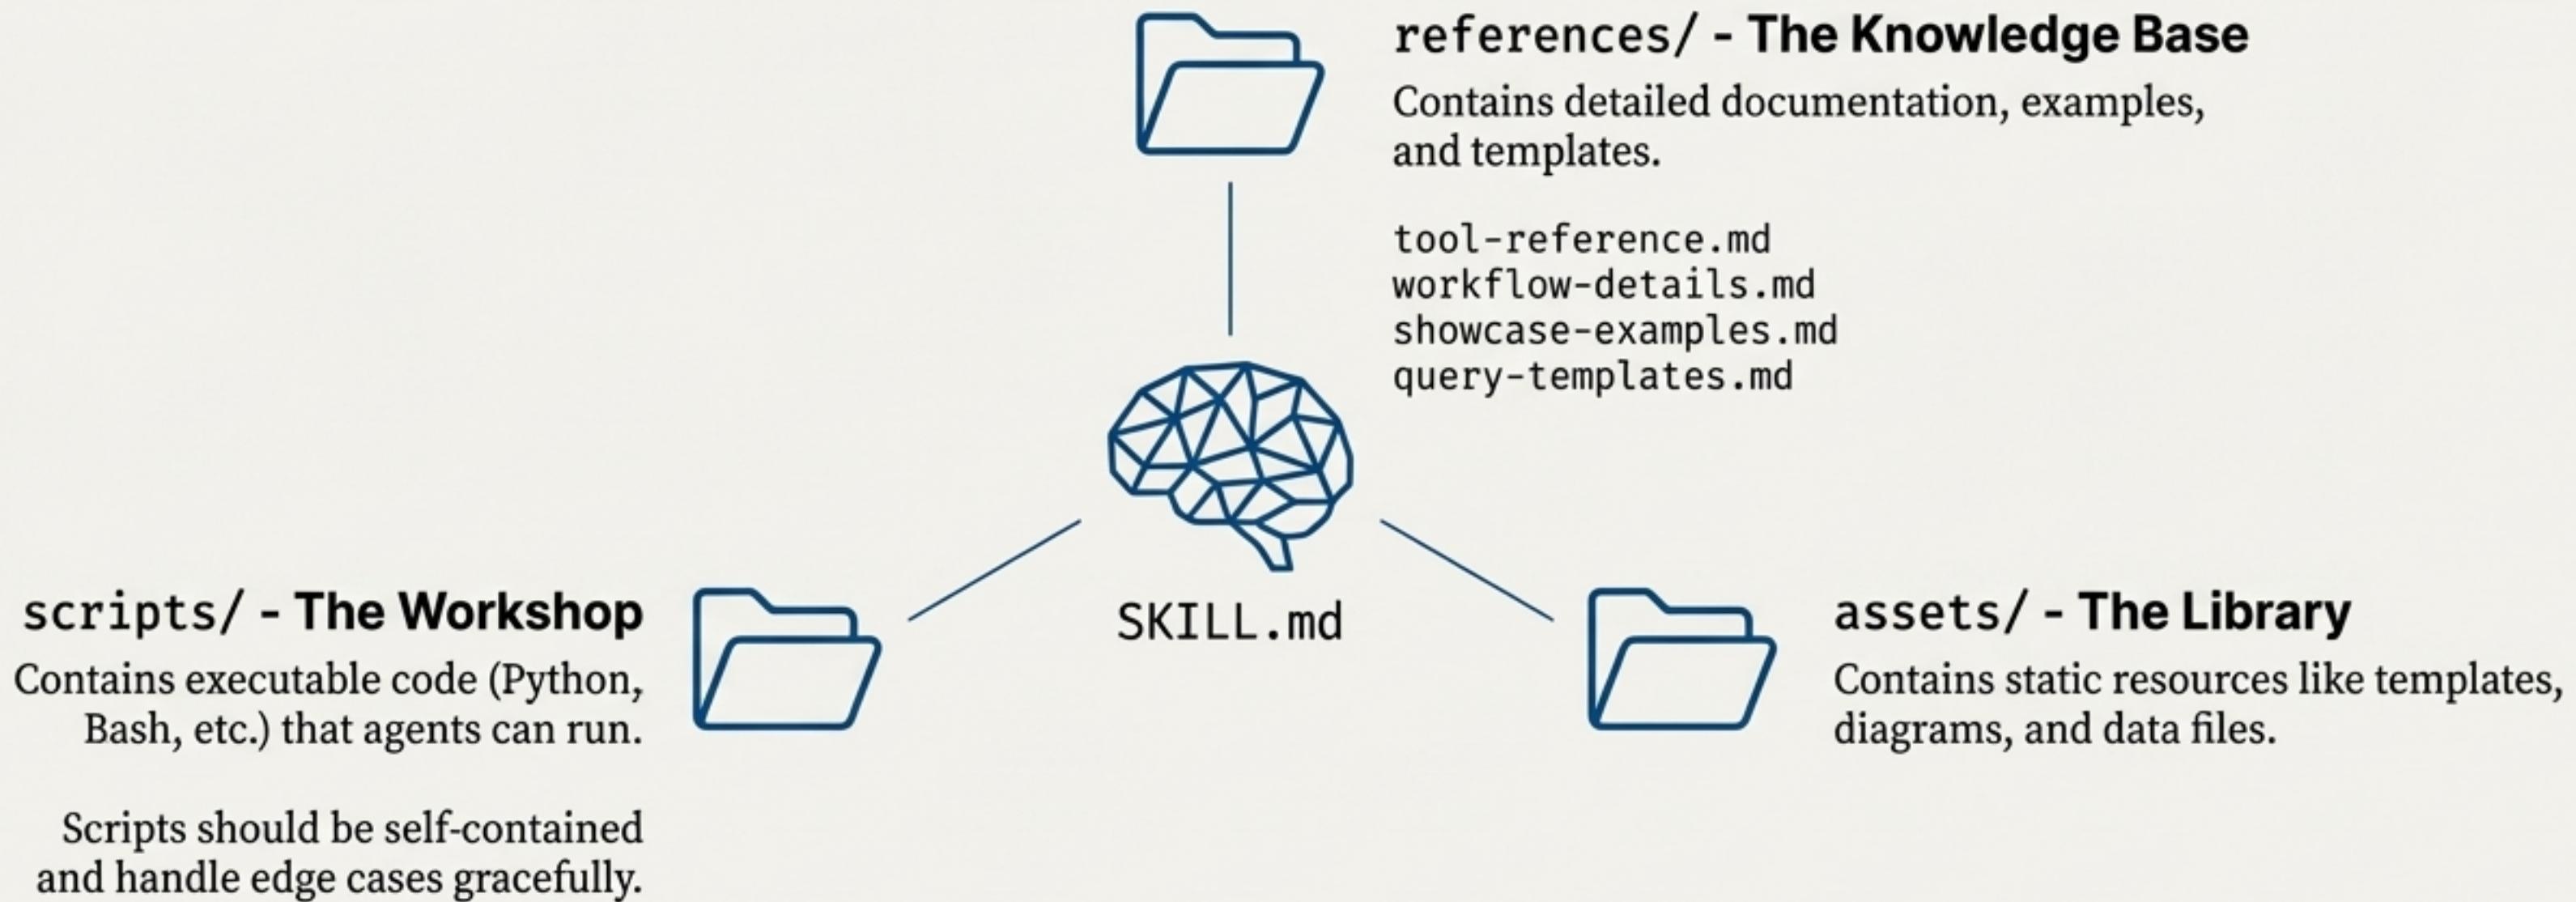

Critical reminders and constraints to ensure reliable and safe execution.

Critical Reminders

1. Always use server-prefixed tool names...
2. Confirm instance at start of conversation...

The Extended Mind: Managing context with Progressive Disclosure.

Skills are designed to be context-efficient. The core SKILL.md is concise, while deep reference material is loaded only when needed.

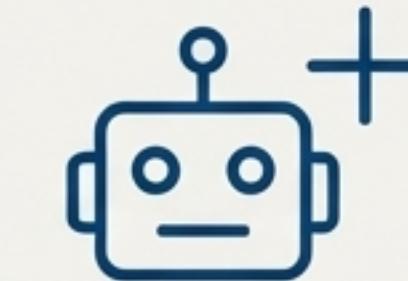

This structure allows an agent to access vast expertise without overwhelming its context window.

A paradigm shift for agent capabilities

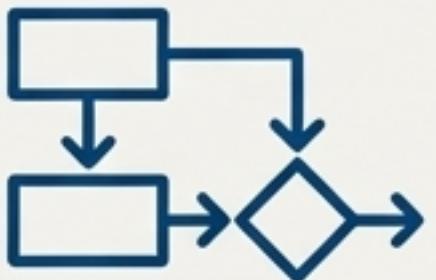

Capture Domain Expertise

Package specialized knowledge into reusable instructions, from legal review processes to data analysis pipelines.

Enable New Capabilities

Give agents entirely new functions, like creating presentations, building servers, or analyzing complex datasets.

Standardize Repeatable Workflows

Turn multi-step tasks that are prone to error into consistent, reliable, and auditable workflows.

Drive Interoperability

Build a skill once and reuse it across different skills-compatible agent products and platforms.

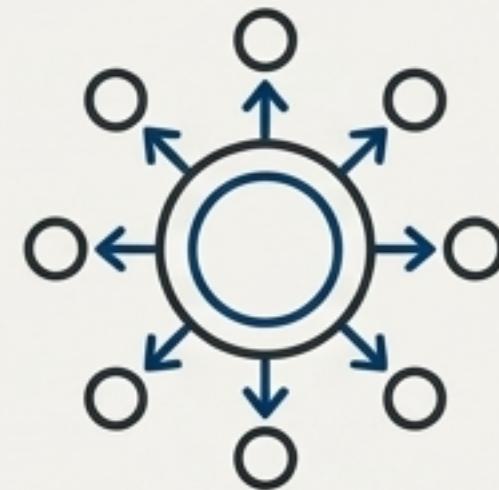

An open standard designed for the entire ecosystem

For Skill Authors

Build once, deploy everywhere.

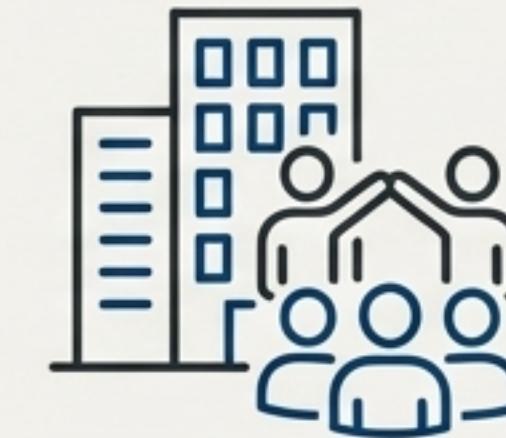

Create powerful capabilities and workflows that can be used across multiple agent products without modification.

For Agent Platforms

Instantly upgrade your agent.

Support for skills lets end-users and developers give your agent new capabilities out of the box, enriching your platform.

For Teams & Enterprises

Codify and control your knowledge.

Capture critical organizational knowledge in portable, version-controlled packages that ensure consistency and reliability.

A growing, open standard built for collaboration.

Origin:

Originally developed by Anthropic and released as an open standard.

Adoption:

Supported by a growing number of leading AI development tools and agent products.

Contribution:

The standard is open to contributions from the broader ecosystem.
